Grothendieck toposes

Basic properties of Grothendieck toposes

For further reading

# The notion of Grothendieck topos I

## Definition

- A site is a pair (*C*, *J*) where *C* is a small category and *J* is a Grothendieck topology on *C*.
- A presheaf on a (small) category  $\mathscr{C}$  is a functor  $P: \mathscr{C}^{op} \to \mathbf{Set}$ .
- Let  $P : \mathscr{C}^{\text{op}} \to \text{Set}$  be a presheaf on  $\mathscr{C}$  and S be a sieve on an object c of  $\mathscr{C}$ . A matching family for S of elements of P is a function which assigns to each arrow  $f : d \to c$  in S an element  $x_f \in P(d)$  in such a way that

$$P(g)(x_f) = x_{f \circ g}$$
 for all  $g : e o d$ .

An amalgamation for such a family is a single element  $x \in P(c)$  such that

$$P(f)(x) = x_f$$
 for all  $f$  in  $S$ .

Olivia Caramello

Grothendieck toposes

Basic properties of Grothendieck toposes

For further reading

# The notion of Grothendieck topos II

- Given a site (*C*, *J*), a presheaf on *C* is a *J*-sheaf if every matching family for any *J*-covering sieve on any object of *C* has a unique amalgamation.
  - The category Sh(C, J) of sheaves on the site (C, J) is the full subcategory of [C<sup>op</sup>, Set] on the presheaves which are *J*-sheaves.
  - A Grothendieck topos is any category of sheaves on a site.

## Examples

- For any (small) category *C*, [*C*<sup>op</sup>, Set] is the category of sheaves Sh(*C*, *T*) where *T* is the trivial topology on *C*.
- For any topological space X, Sh(𝒫(X), J<sub>𝒫(X)</sub>) is equivalent to the usual category Sh(X) of sheaves on X.

### Theorem

Let  $(\mathcal{C}, J)$  be a site. Then

- the inclusion  $\mathbf{Sh}(\mathscr{C}, J) \hookrightarrow [\mathscr{C}^{op}, \mathbf{Set}]$  has a left adjoint
  - $a : [\mathscr{C}^{op}, \mathbf{Set}] \to \mathbf{Sh}(\mathscr{C}, J)$  (called the associated sheaf functor), which preserves finite limits.
- The category  $\mathbf{Sh}(\mathscr{C}, J)$  has all (small) limits, which are preserved by the inclusion functor  $\mathbf{Sh}(\mathscr{C}, J) \hookrightarrow [\mathscr{C}^{op}, \mathbf{Set}]$ ; in particular, limits are computed pointwise and the terminal object  $1_{\mathbf{Sh}(\mathscr{C}, J)}$  of  $\mathbf{Sh}(\mathscr{C}, J)$  is the functor  $T : \mathscr{C}^{op} \to \mathbf{Set}$  sending each object  $c \in Ob(\mathscr{C})$  to the singleton {\*}.
- The associated sheaf functor a : [𝔅<sup>op</sup>, Set] → Sh(𝔅, J) preserves colimits; in particular, Sh(𝔅, J) has all (small) colimits.
- The category Sh(C, J) has exponentials, which are constructed as in the topos [C<sup>op</sup>, Set].

• The category Sh(C,J) has a subobject classifier.

# The subobject classifier in $\mathbf{Sh}(\mathcal{C}, J)$

Given a site (𝔅, J) and a sieve S in 𝔅 on an object c, we say that S is J-closed if for any arrow f : d → c, f\*(S) ∈ J(d) implies that f ∈ S.

• Let us define  $\Omega_J : \mathscr{C}^{op} \to \mathbf{Set}$  by:  $\Omega_J(c) = \{R \mid R \text{ is a } J\text{-closed sieve on } c\}$  (for an object  $c \in \mathscr{C}$ ),  $\Omega_J(f) = f^*(-)$  (for an arrow f in  $\mathscr{C}$ ), where  $f^*(-)$  denotes the operation of pullback of sieves in  $\mathscr{C}$ along f. Then the arrow  $true : 1_{\mathbf{Sh}(\mathscr{C},J)} \to \Omega_J$  defined by:  $true(*)(c) = M_c$  for each  $c \in Ob(\mathscr{C})$ 

is a subobject classifier for  $Sh(\mathcal{C}, J)$ .

• The classifying arrow  $\chi_{A'} : A \to \Omega_J$  of a subobject  $A' \subseteq A$  in **Sh**( $\mathscr{C}, J$ ) is given by:

$$\chi_{\mathcal{A}'}(c)(x) = \{f: d 
ightarrow c \mid \mathcal{A}(f)(x) \in \mathcal{A}'(d)\}$$
